

# Development of Artificial Reverberation in C++

**William Sieber**

Majors: Computer Science, Music

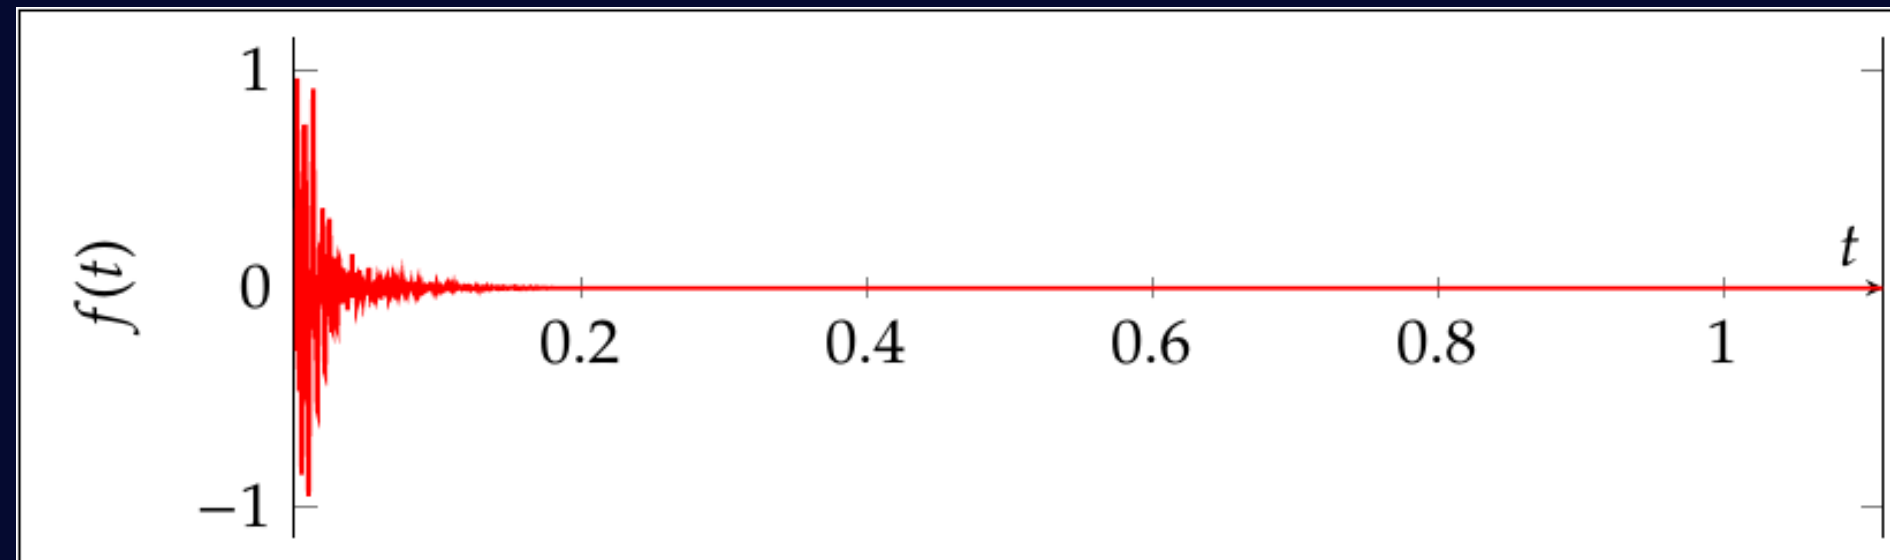

Advised by: Daniel Palmer, Greg Slawson

# Overview

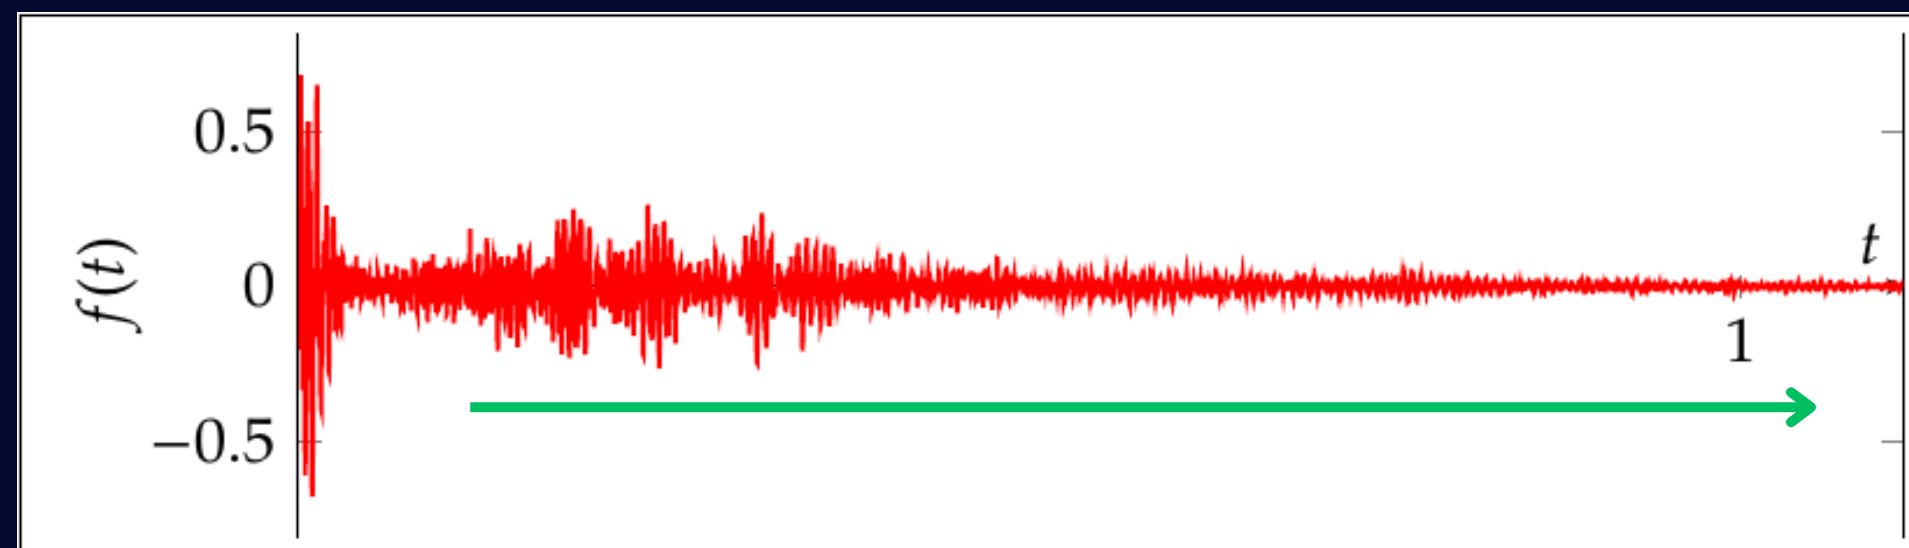

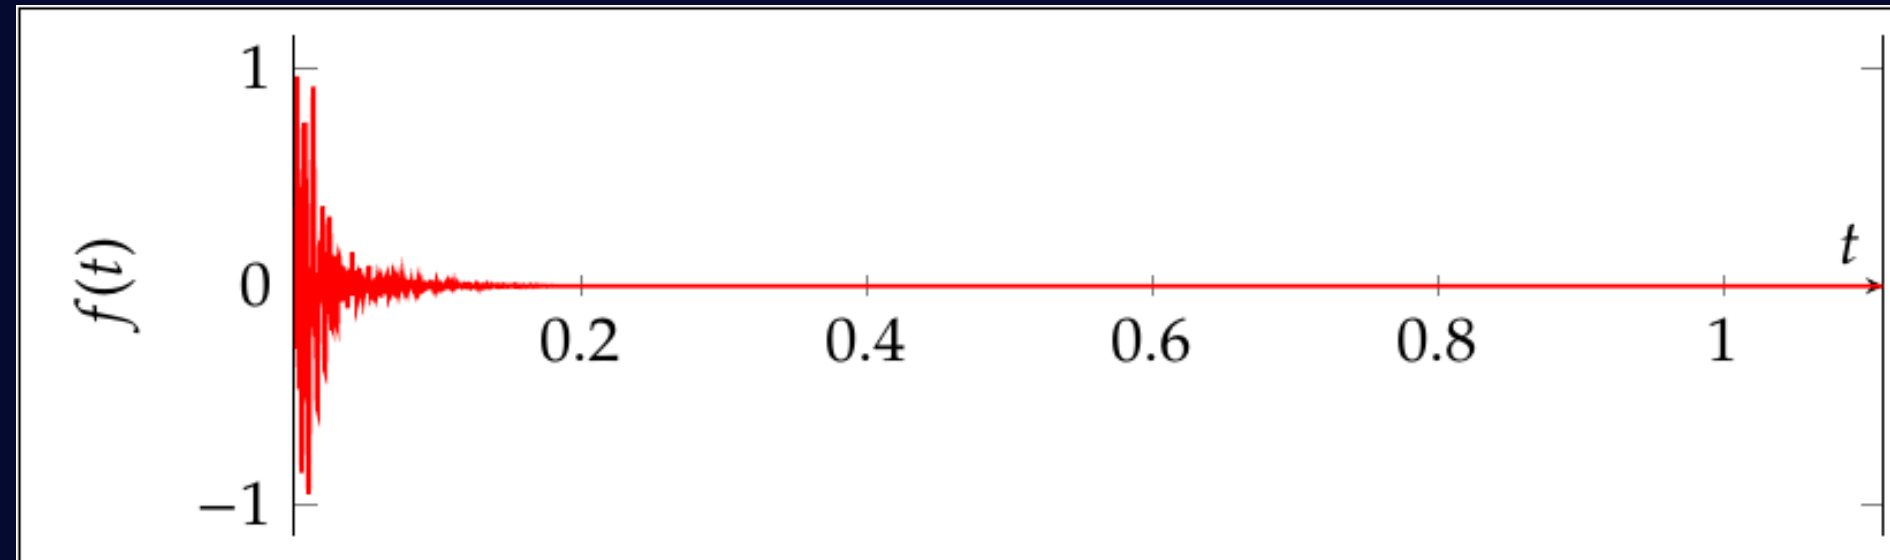

- Background Information
  - “What is reverb?”
- The Details
  - “How does digital audio work?”
- Measuring Reverb + The Code
  - “How does one create and evaluate reverb?”

# Background

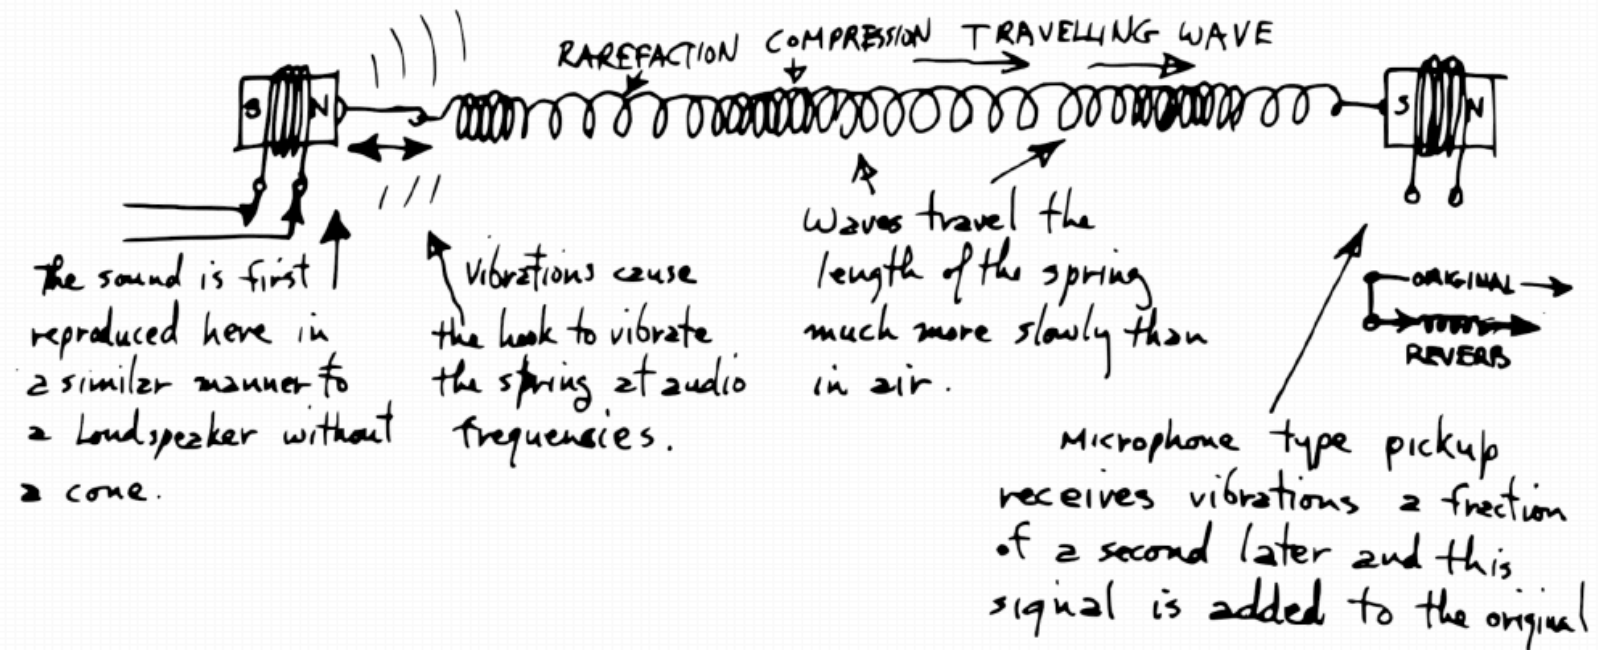

# Background

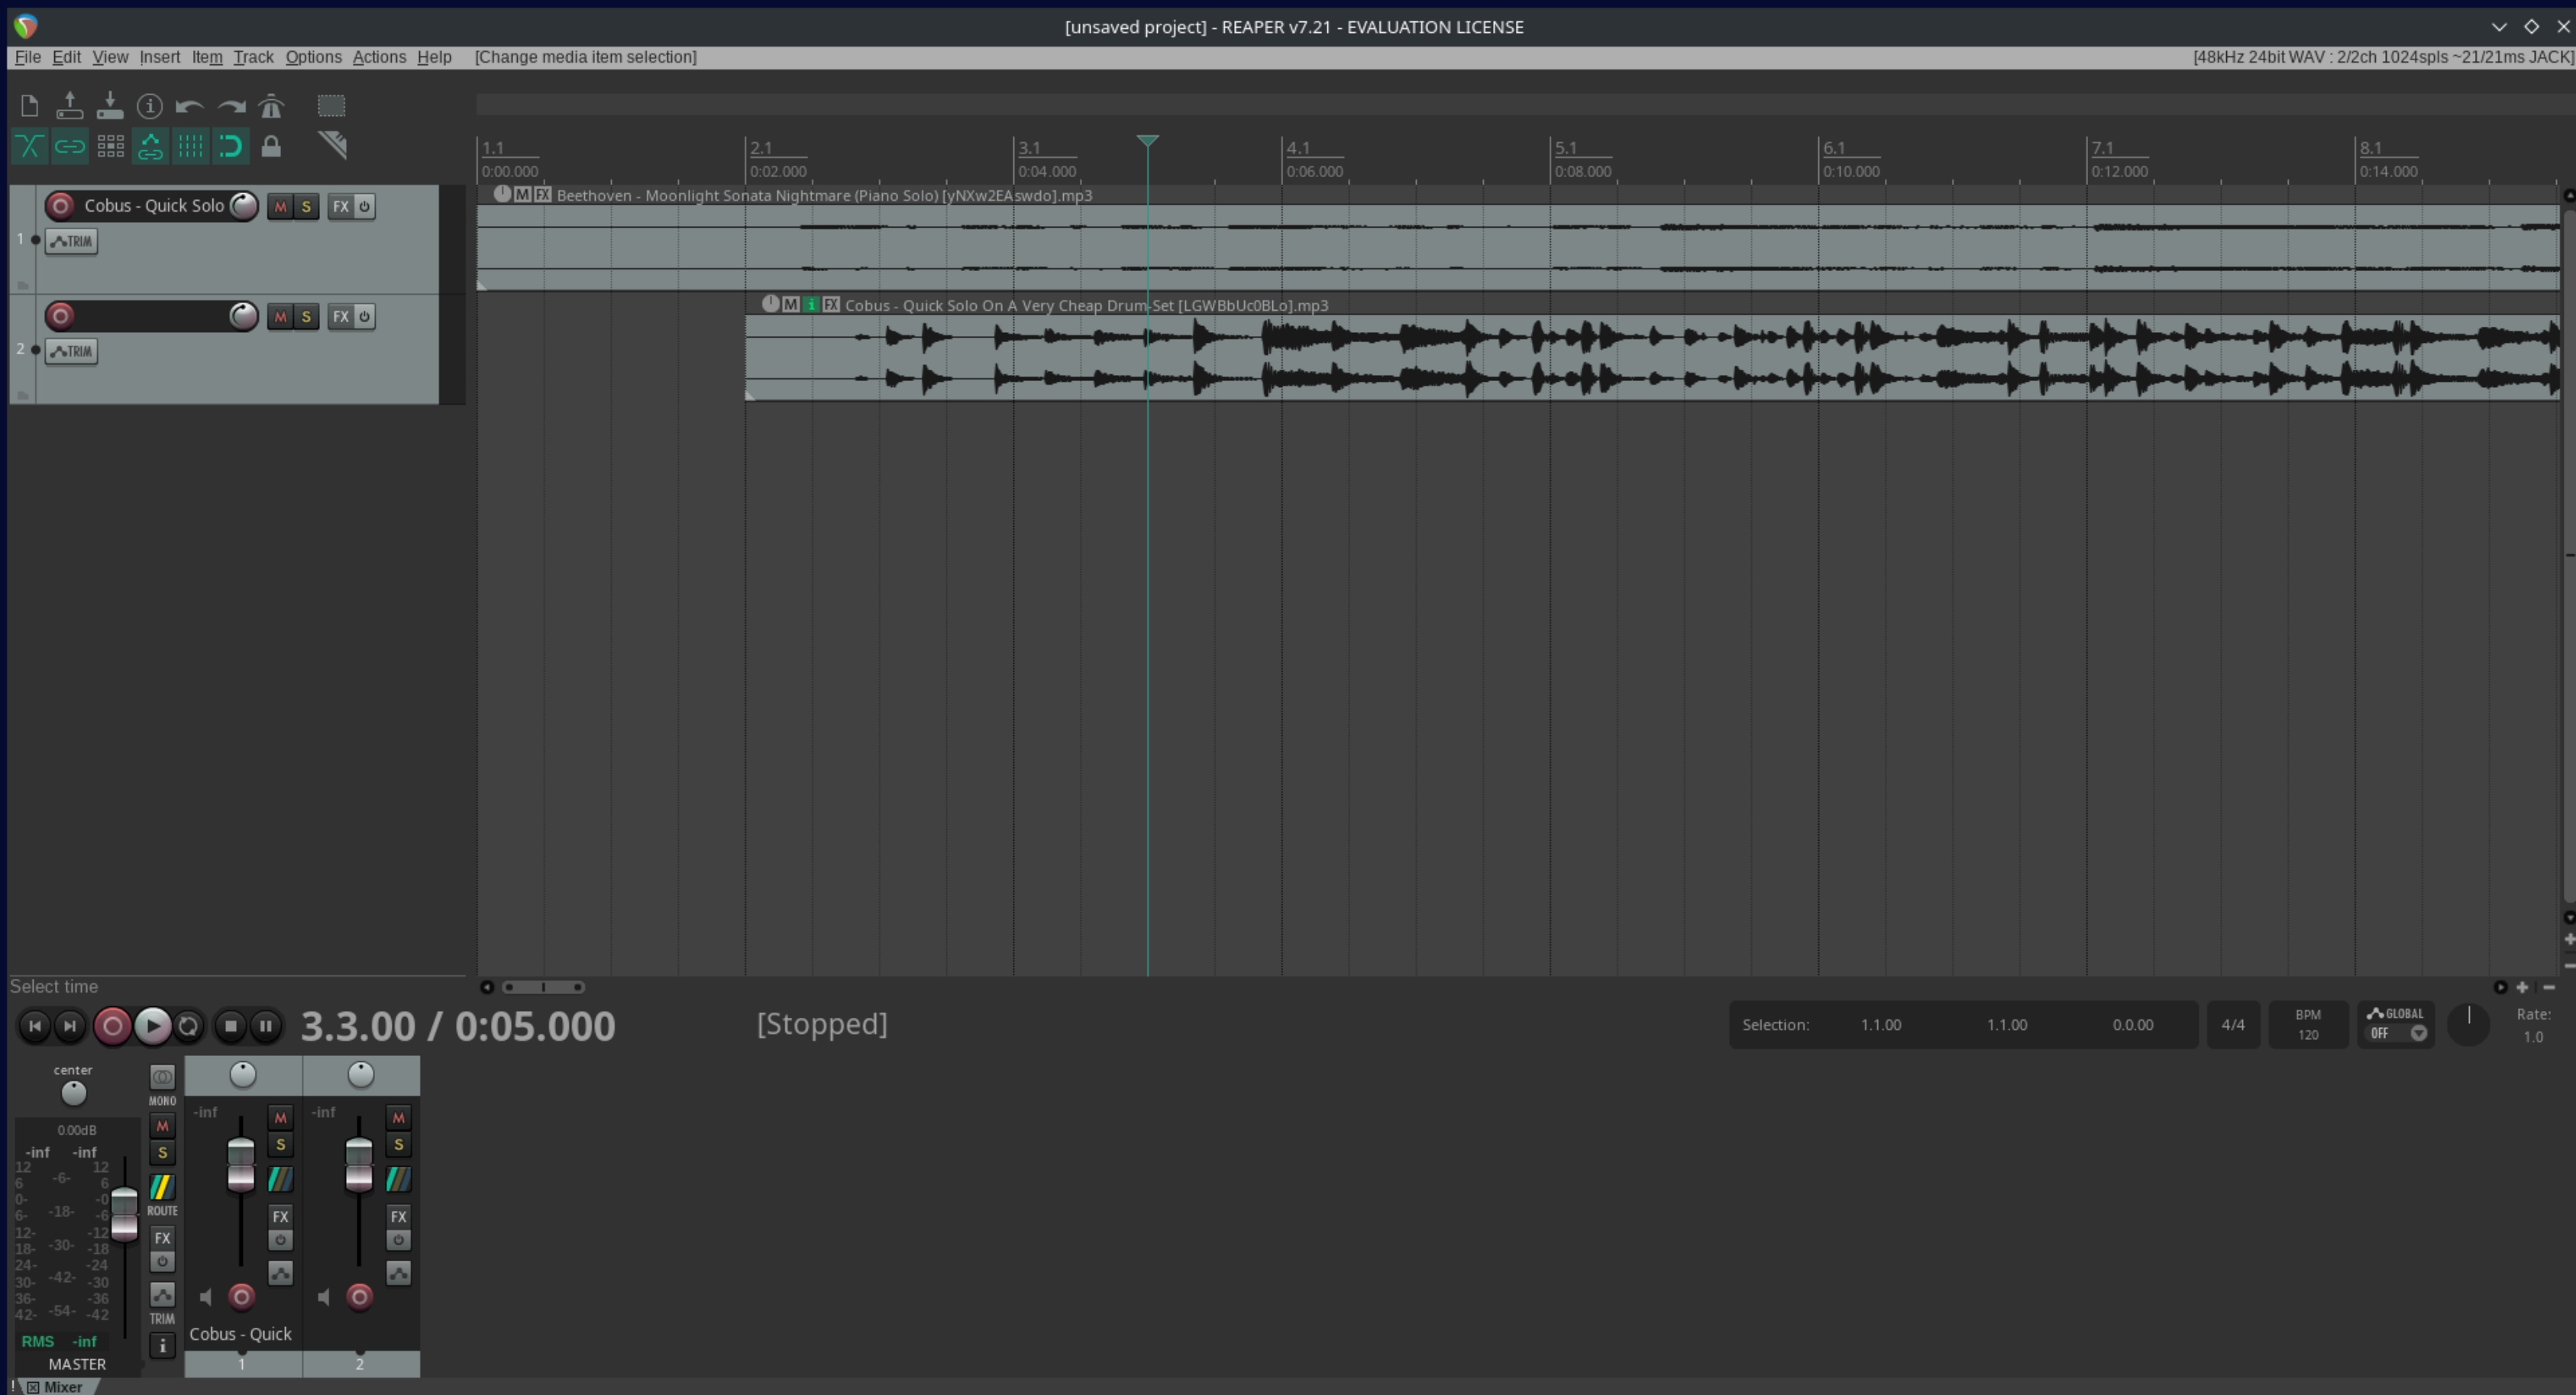

# Background

Most Reverb units on synthesizers leave something to be desired but they are useful components none the less. Such units are usually spring type arrangements using the following basic principle:

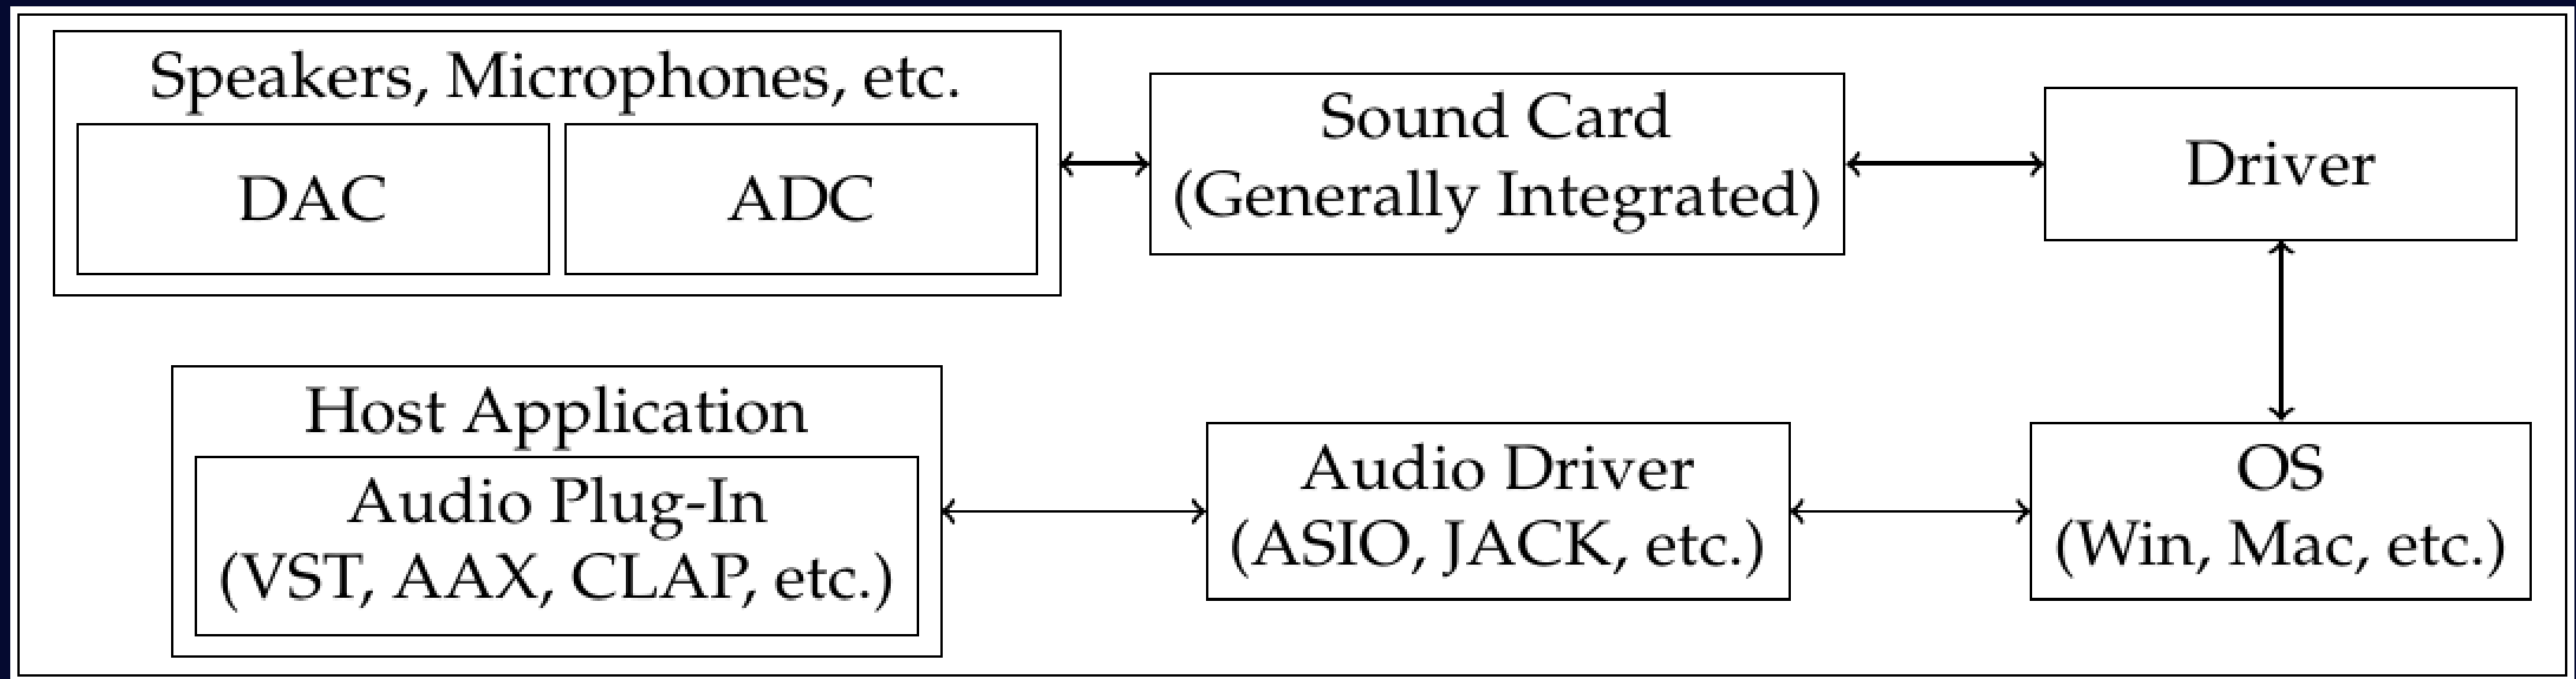

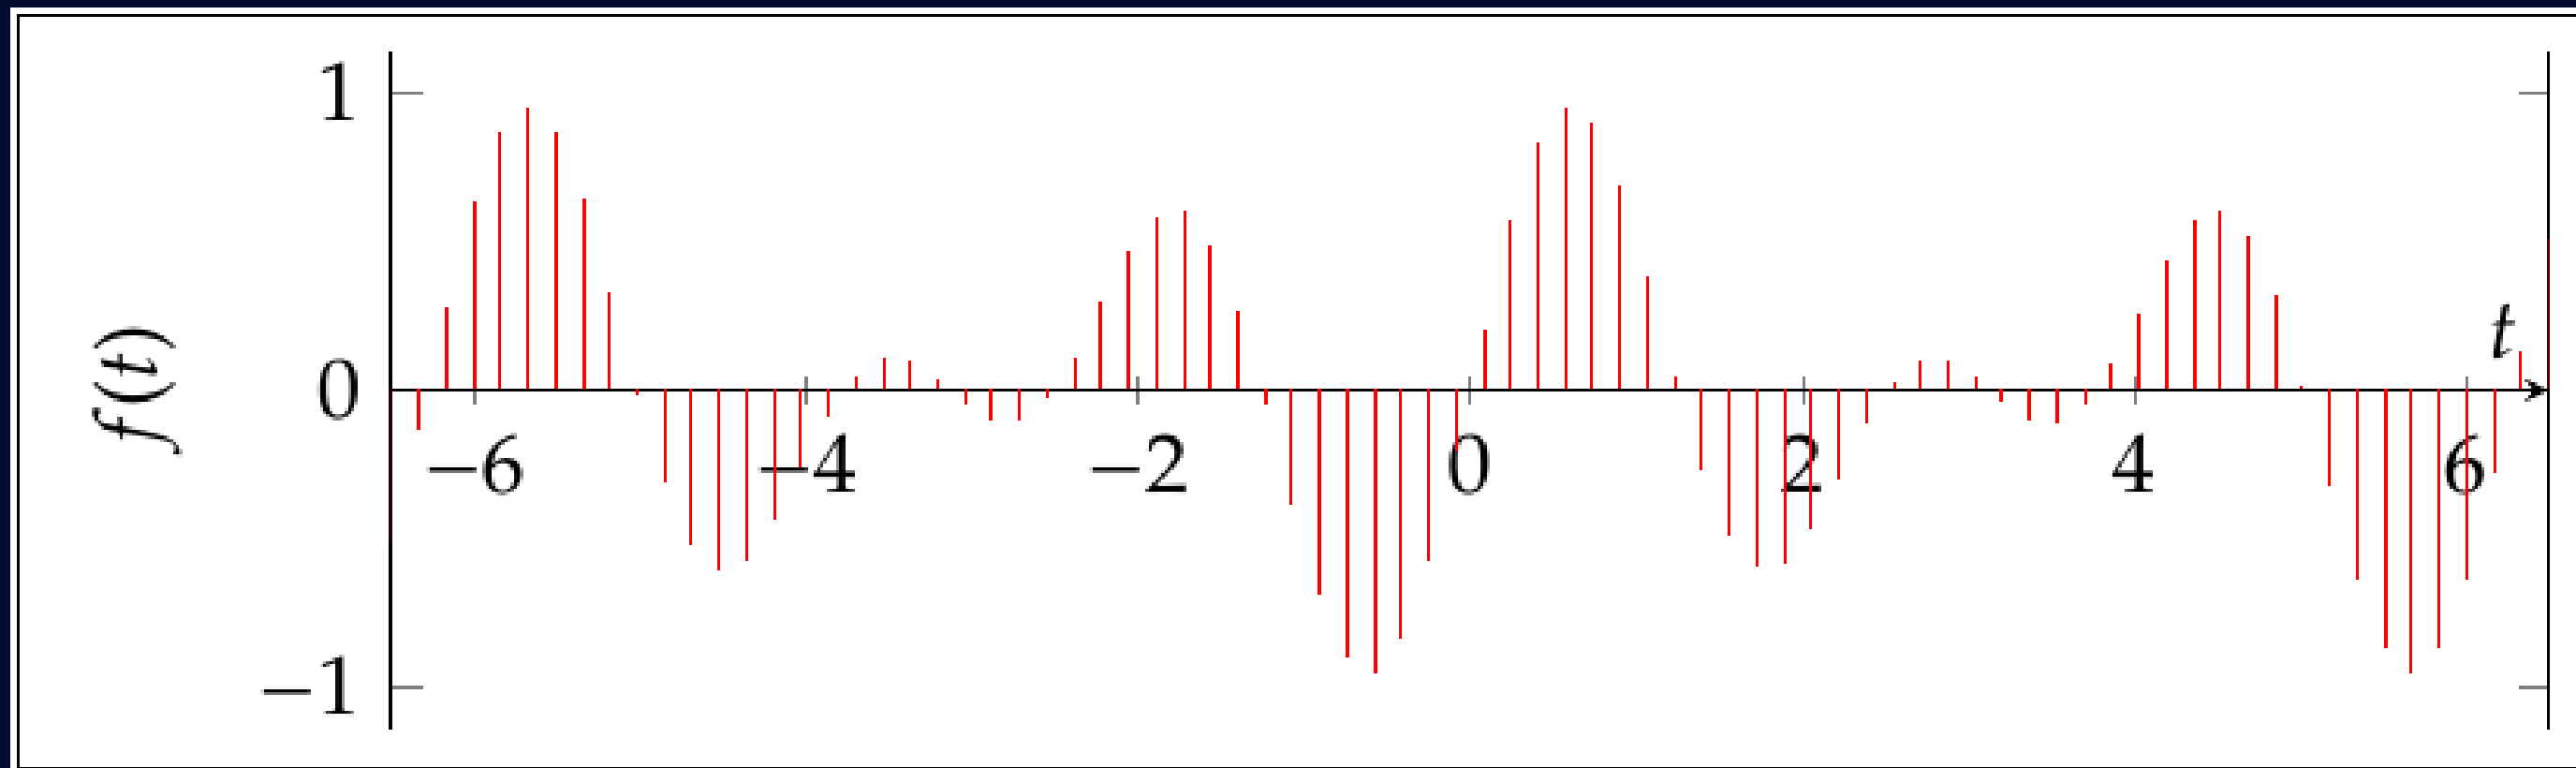

# The Details

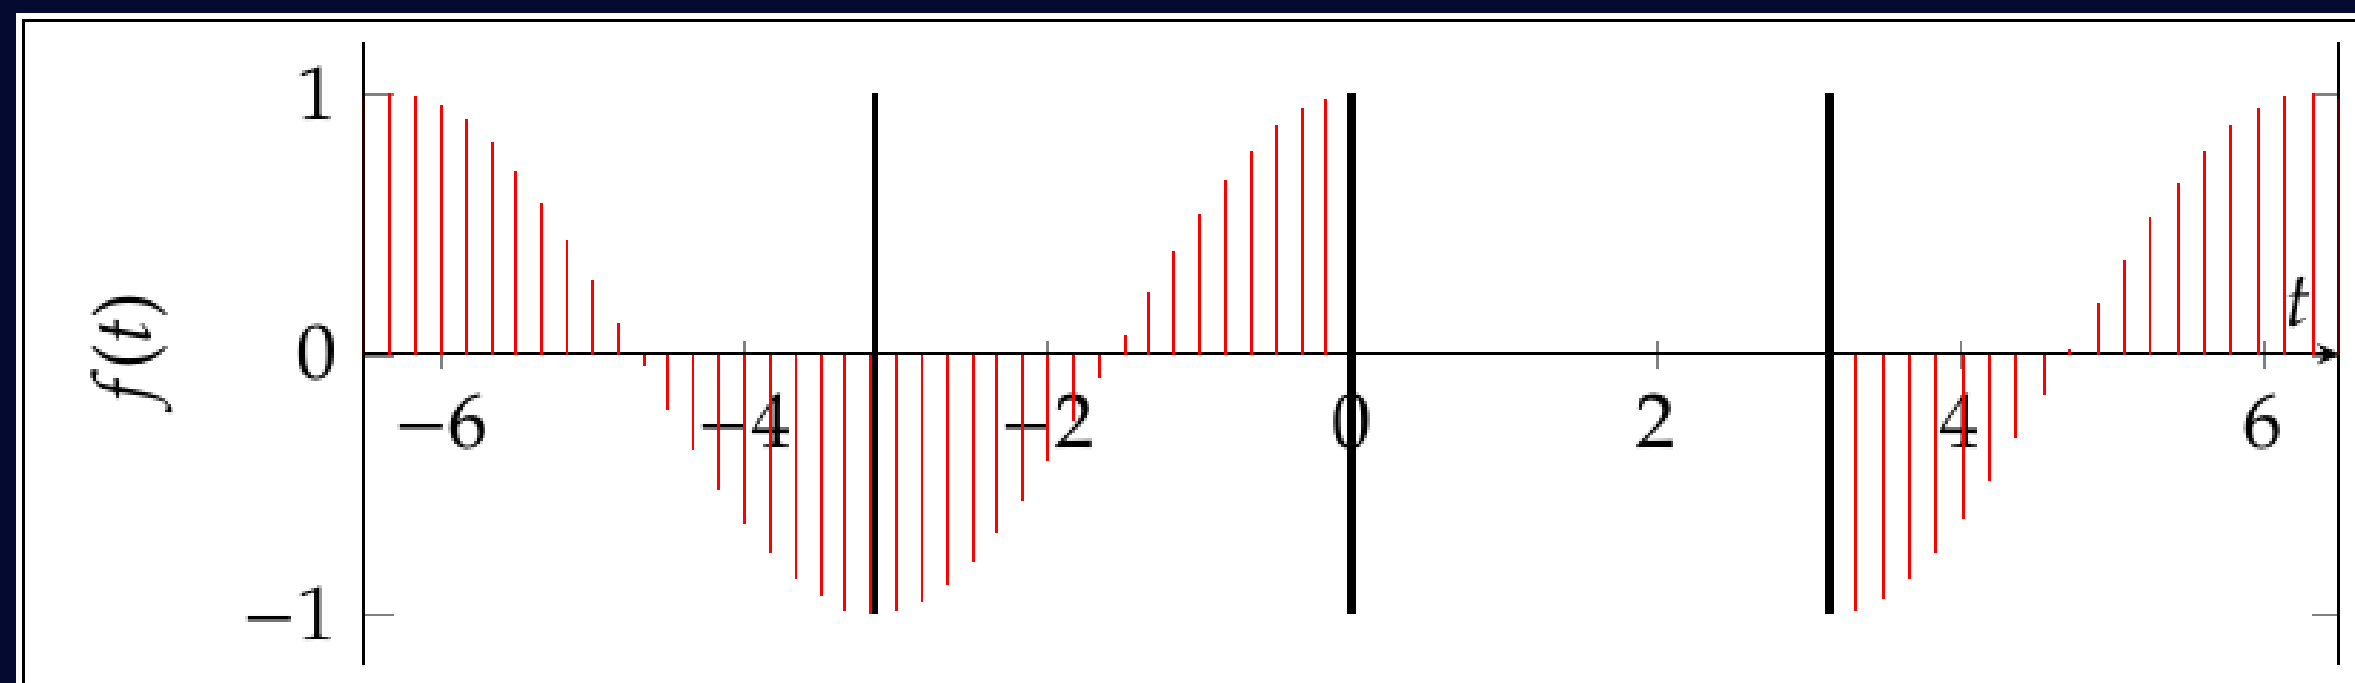

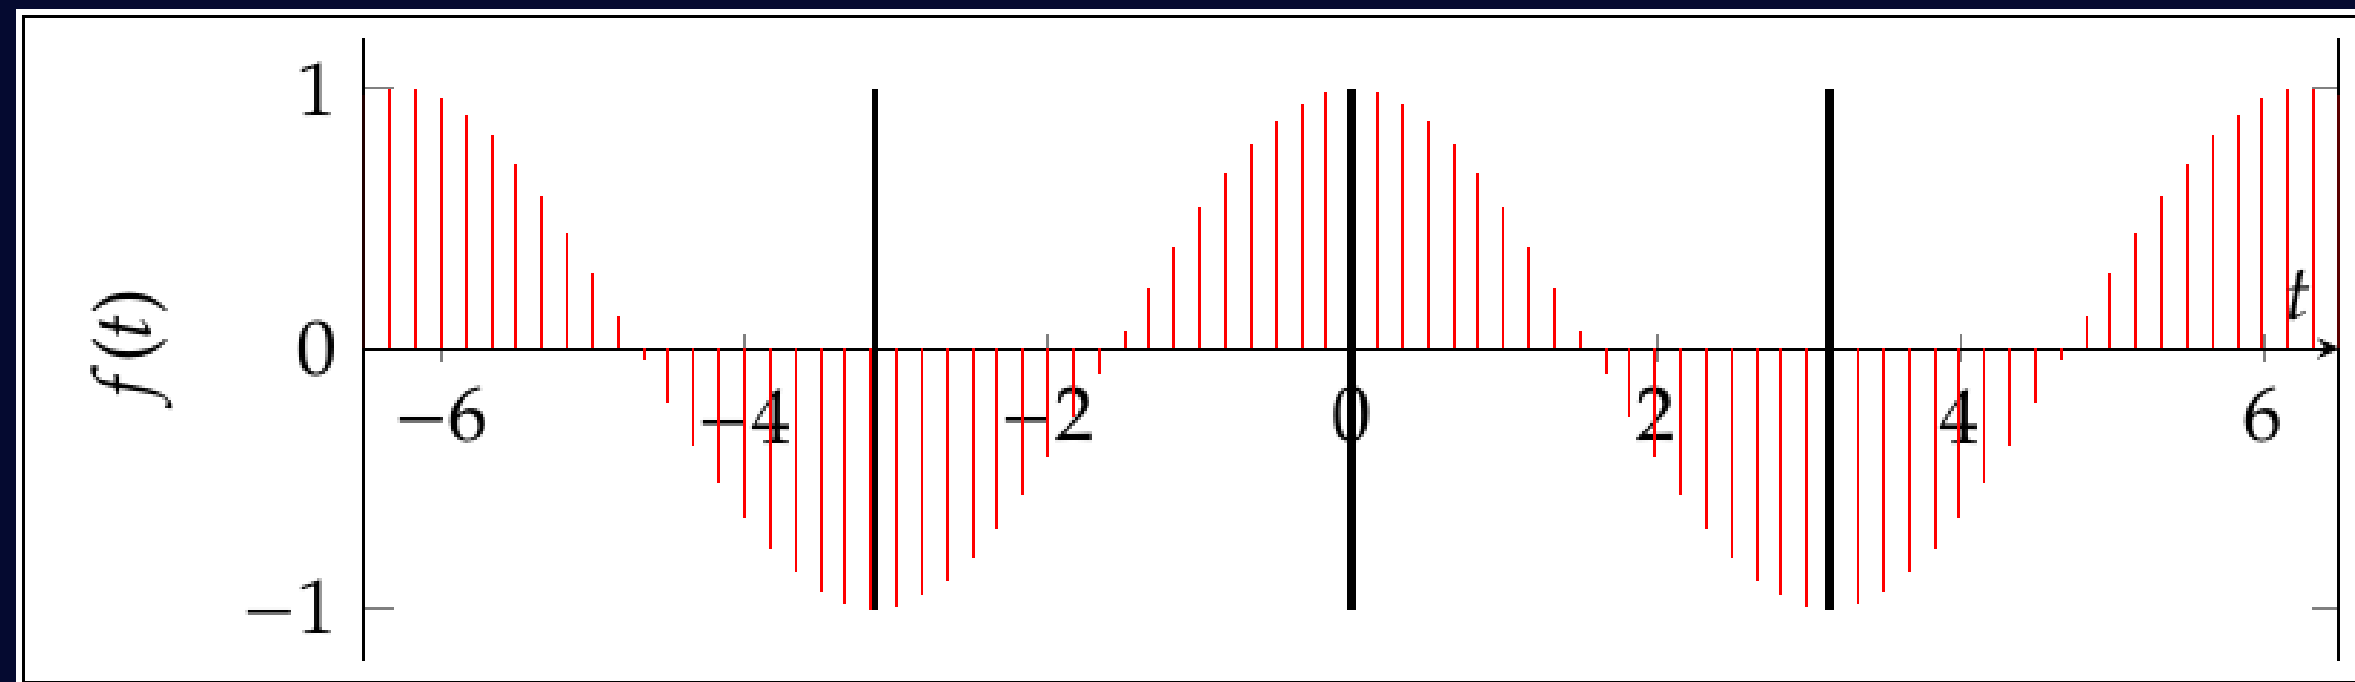

# The Details

# The Details

# The Details

# To Summarize...

- Think in terms of video games:
- MP3s are akin to “watching” someone play a game.
- DAWs generate audio on-the-fly - they “play the game itself”.

# Measuring Reverb

- To test whatever algorithm is chosen, it is necessary to have a baseline to compare against.
- To do this, one can measure a real acoustic space.

# Measuring Reverb

- Reverberation time is measured by how long it takes persisted sound to decrease by 60 dB.
- One can predict this value by measuring the room itself (Gault Recital Hall).

$$RT_{60} = 0.049 \frac{V_R}{A_t}$$

$$A_t = S_1\alpha_1 + S_2\alpha_2 + S_3\alpha_3 + \dots + S_n\alpha_n$$

# Measuring Reverb

Materials	125 Hz	250 Hz	500 Hz	1 kHz	2 kHz	4 kHz	Average
Cushioned Seats	0.32	0.4	0.42	0.44	0.43	0.48	<b>0.415</b>
Wood Parquet	0.04	0.04	0.07	0.06	0.06	0.07	<b>0.057</b>
Rough Concrete	0.01	0.02	0.04	0.06	0.08	0.1	<b>0.052</b>
Plaster	0.01	0.02	0.02	0.03	0.04	0.05	<b>0.028</b>
Metal Panels	0.51	0.78	0.57	0.77	0.9	0.79	<b>0.72</b>

**Table 5.1:** Relevant Absorption Coefficients [33].

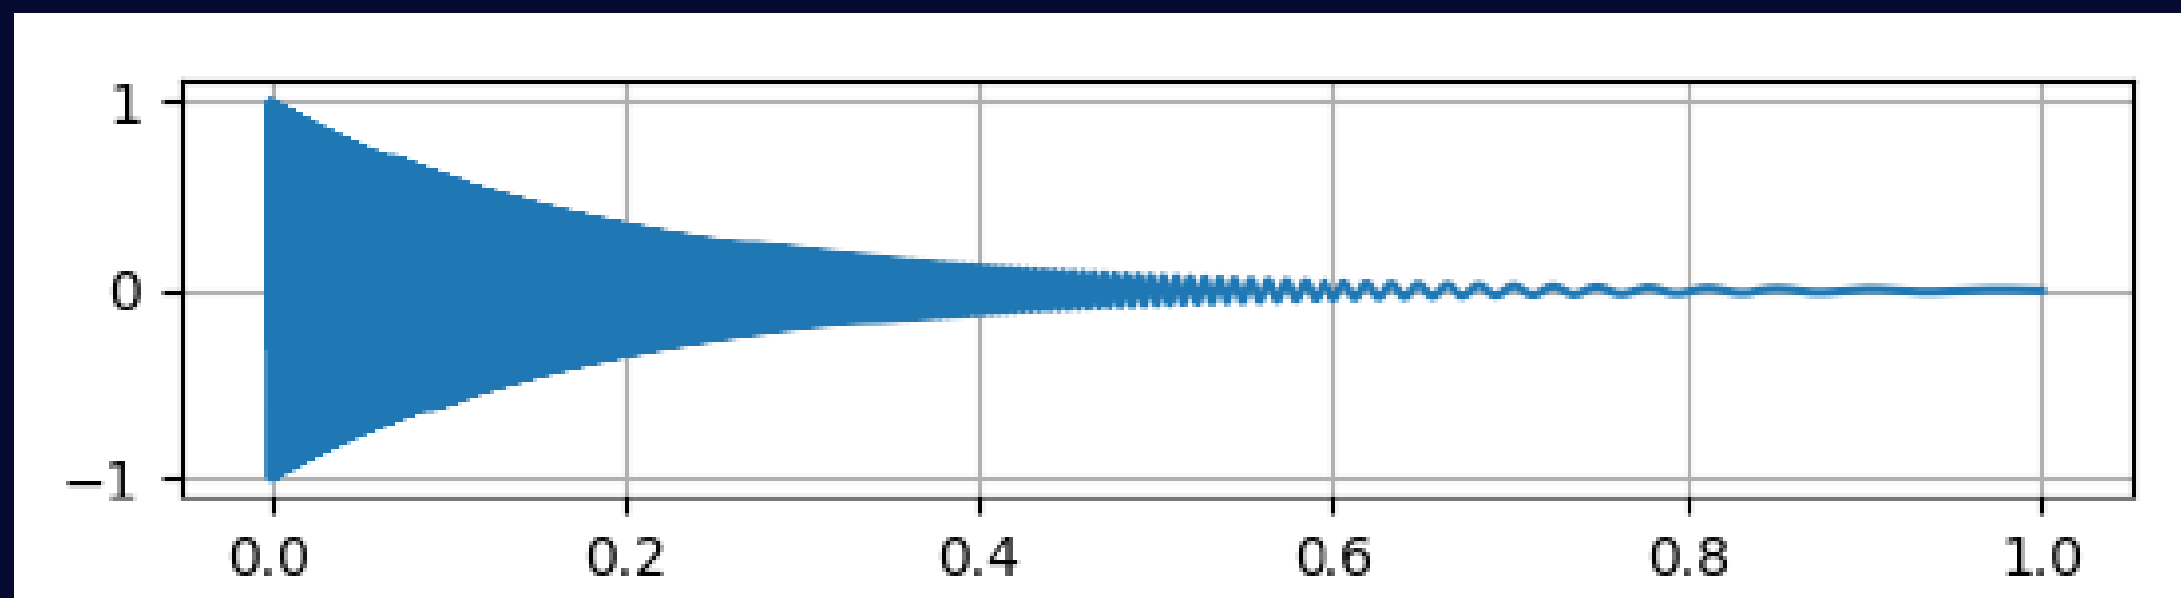

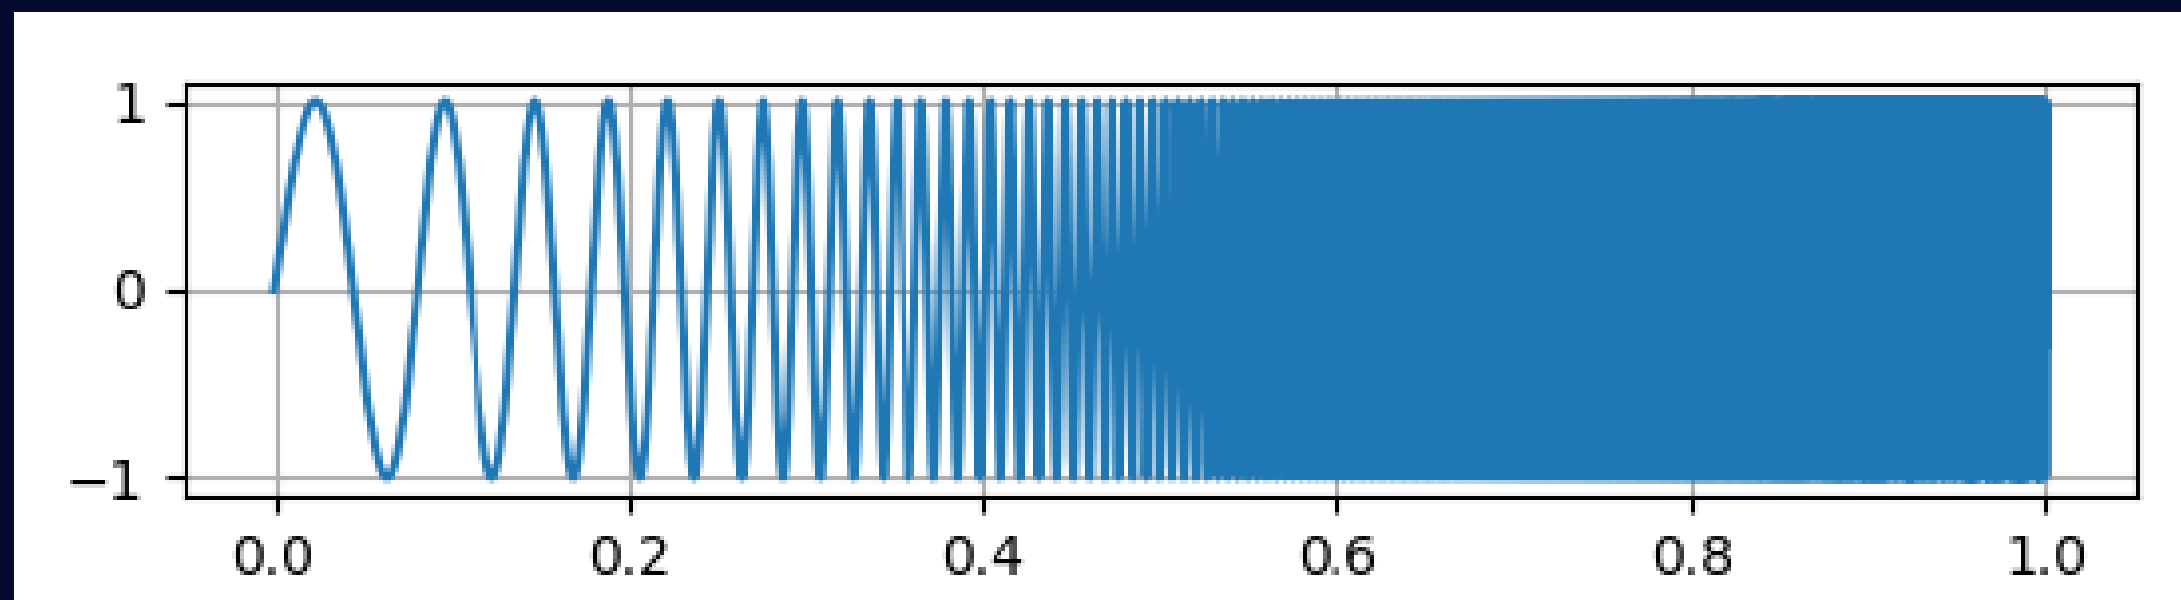

$$RT_{60} = 0.049 \frac{104,609 ft^3}{4149.7}$$

$$\therefore RT_{60} = 1.23s$$

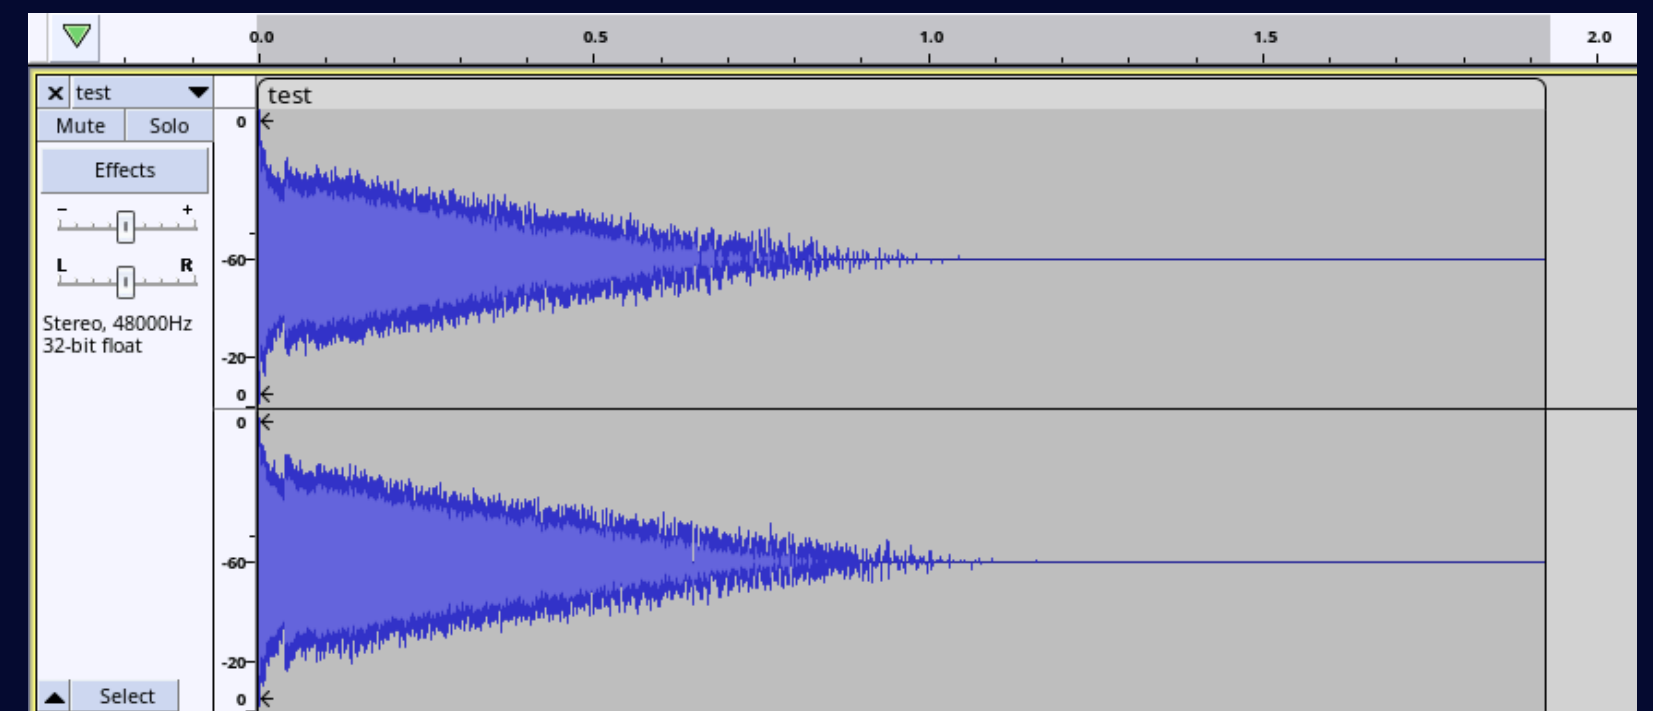

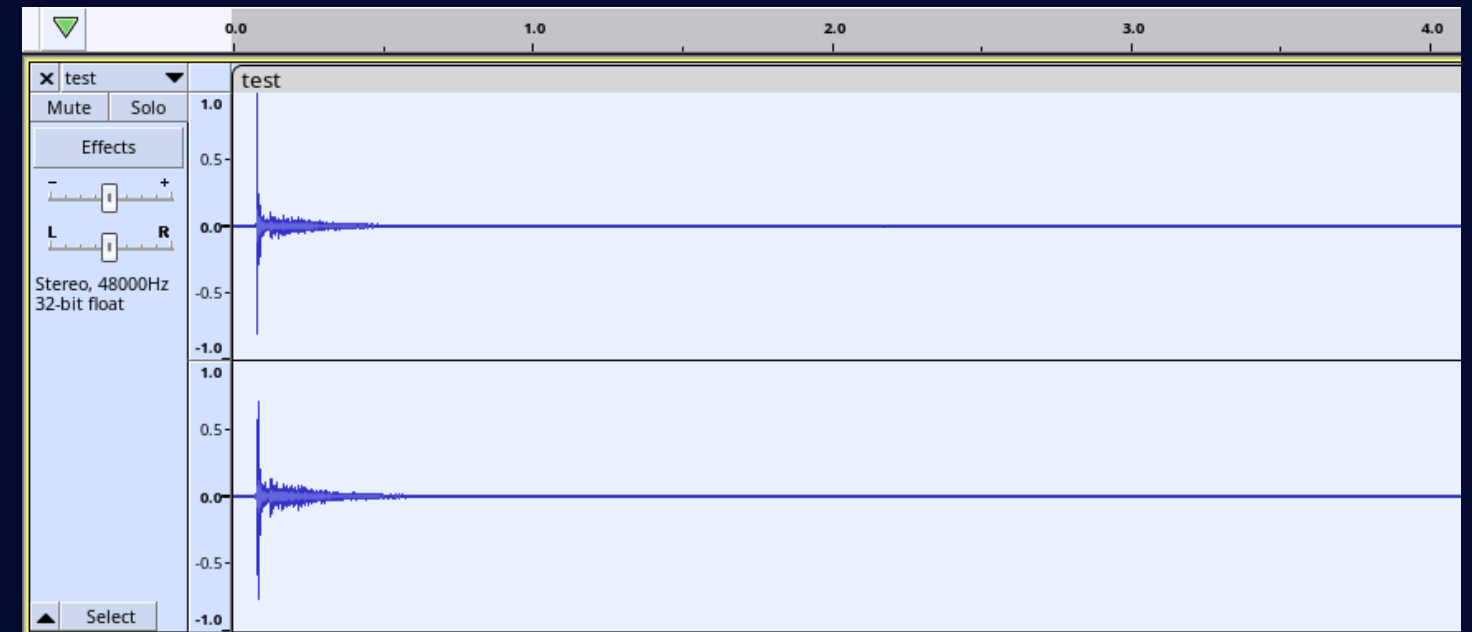

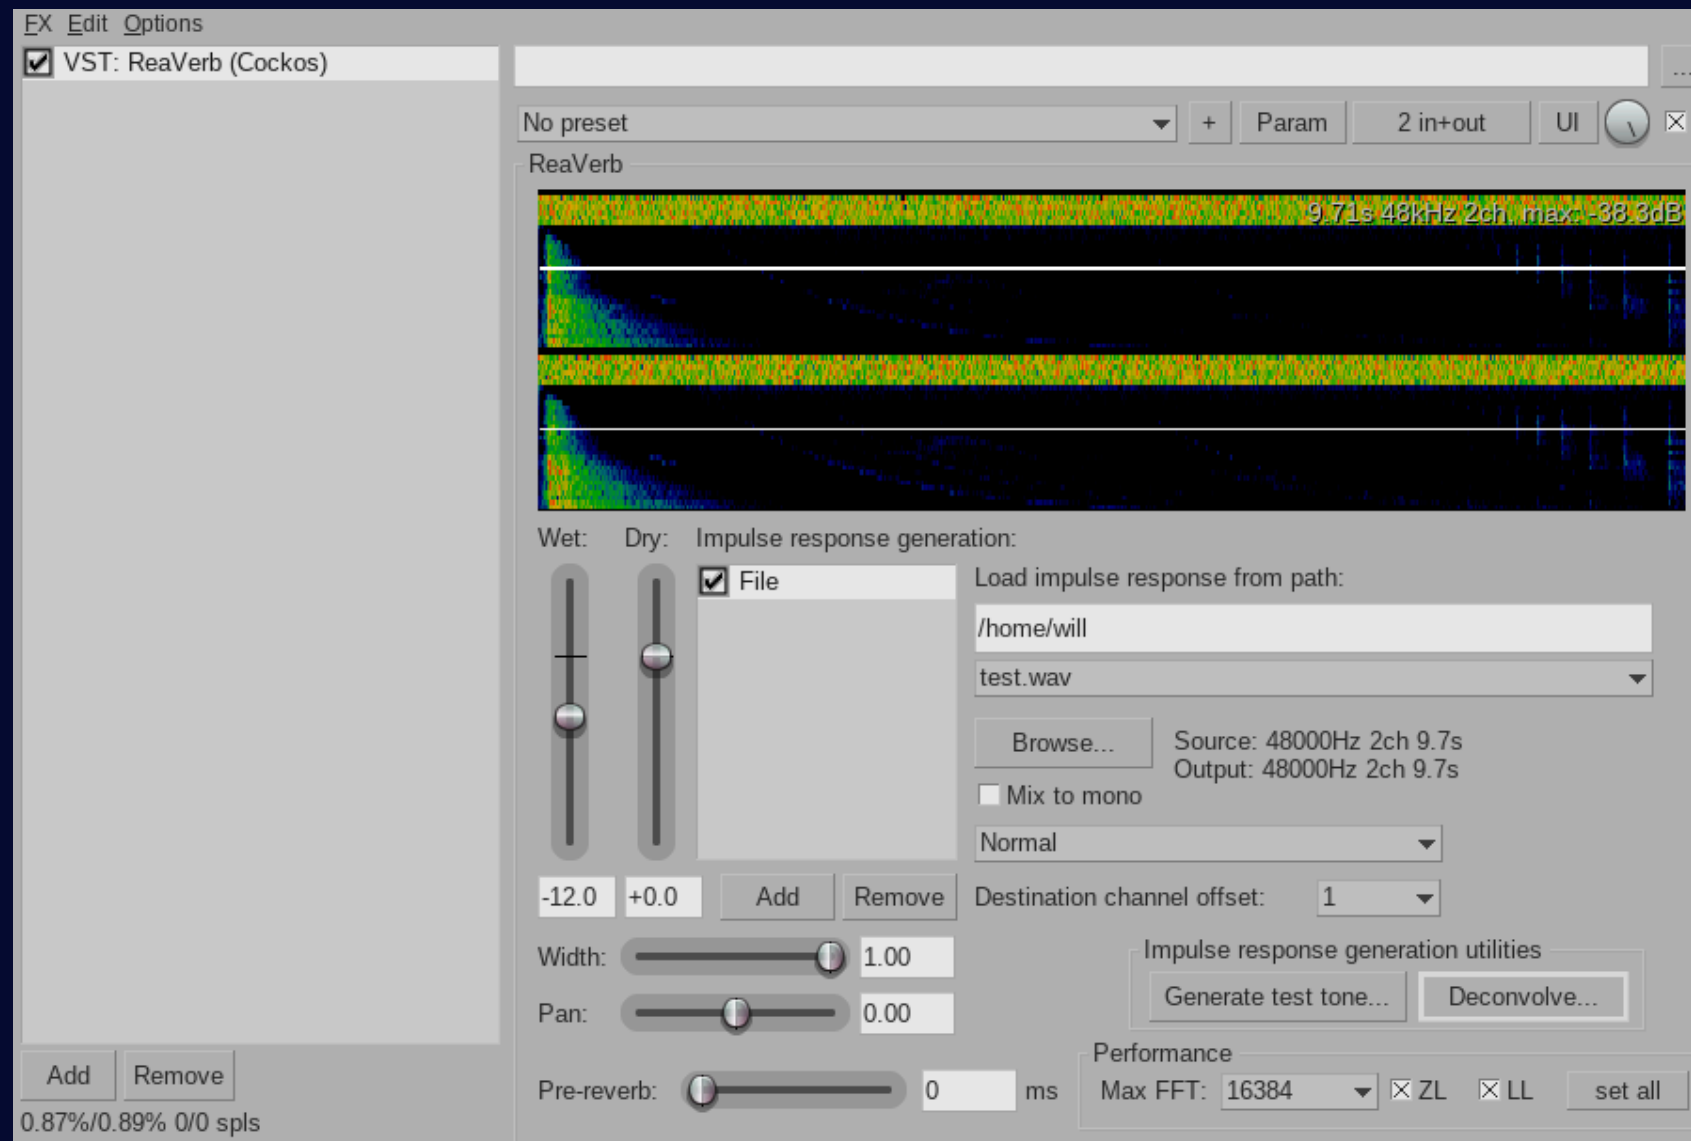

$$A_t = \underbrace{2360.3 ft^2 \cdot 0.415}_{\text{Audience Floor}} + \underbrace{1473.75 ft^2 \cdot 0.057}_{\text{Stage Floor}} + \underbrace{4953.3 ft^2 \cdot 0.052}_{\text{Audience Walls}} + \underbrace{2431 ft^2 \cdot 0.028}_{\text{Stage Walls}} + \underbrace{3834.1 ft^2 \cdot 0.72}_{\text{Ceiling}}$$

$$A_t = 4149.7 \text{ sabins}$$

# The Code

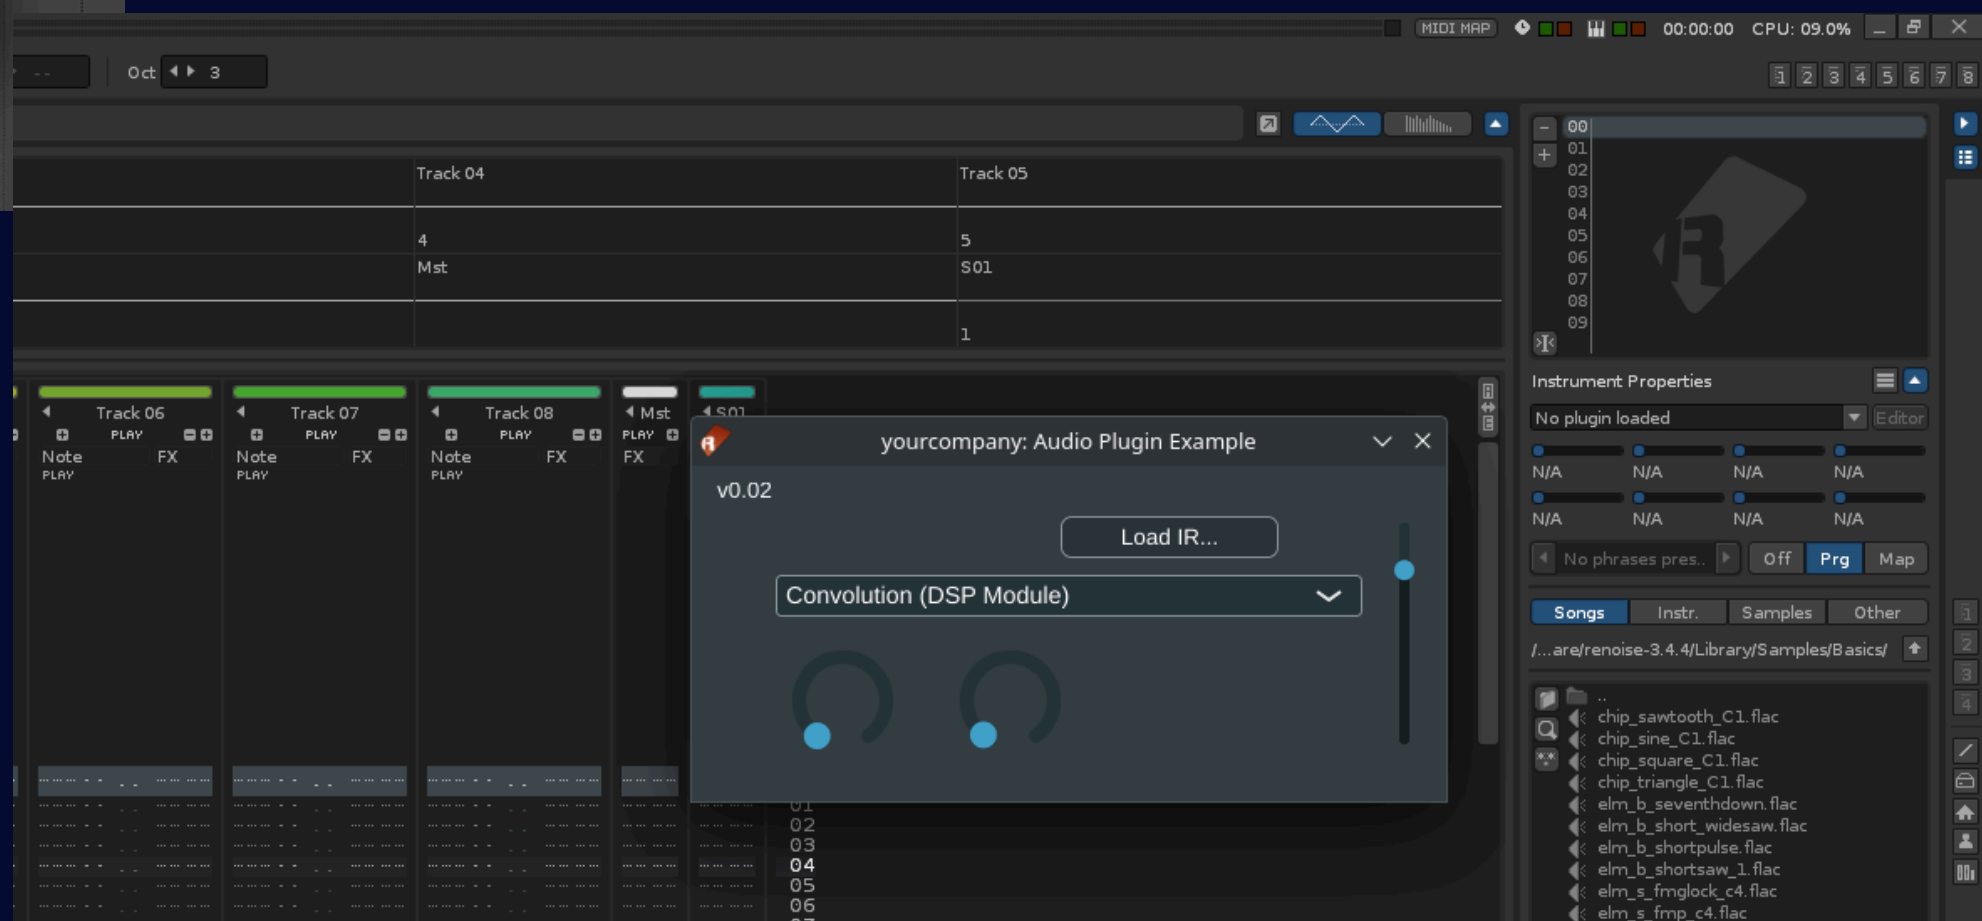

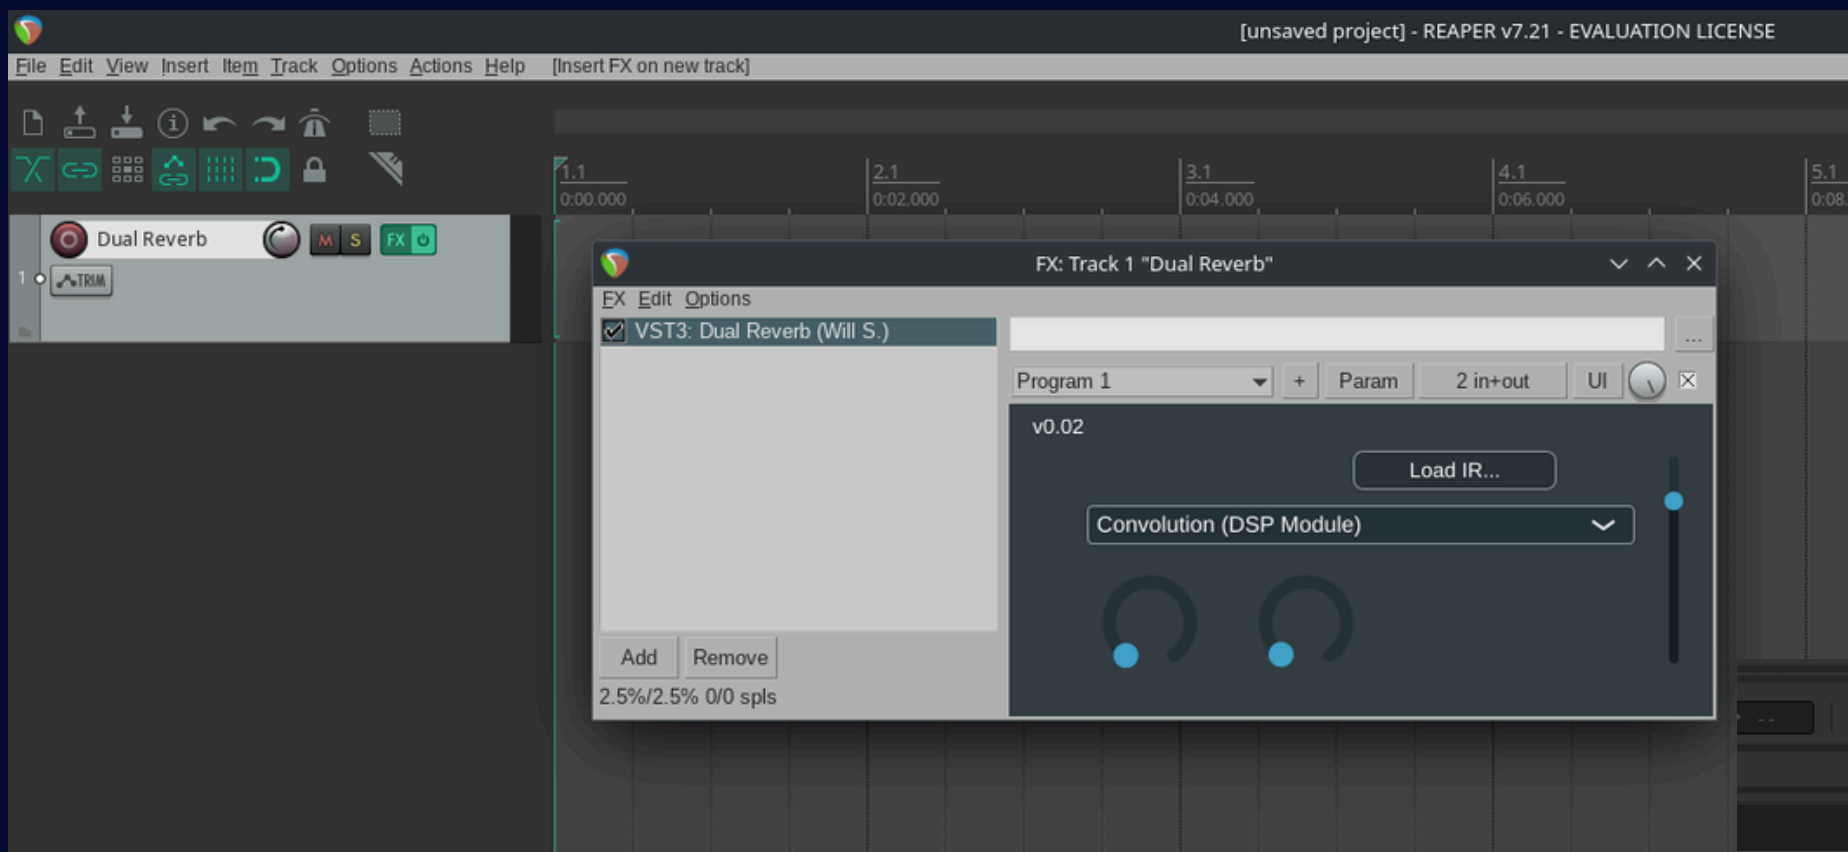

# The Code

# Future Work

- Exploring Different Algorithms (FDN).
- Creating more efficient code that relies less on JUCE.
- Use these sample principles to create different effects.

**Thank You!**
